

Title: **The Bridge, connecting universities universe**

Topic: **Future Universities**

Author/s: **PRIATMOKO, Setiawan (Hungarian University of Agriculture and Life Sciences - MATE)**

The challenge of disseminating research results from universities to the public is an important issue for society. Public trust to mankind can be seen from the extent to which people see the benefits of the results of academic and faculty member's research. To reduce inequities in education system and knowledge, a radical step is needed. The Bridge is an ICT-based platform concept idea that connects research result manuscripts from several universities to be easy understandable for common and non-higher degree educated people. The Bridge bring the world of higher education to the community with a smart system. ICT used in The Bridge is a solution to reduce the gap. The work concept is extracting, translating, and combining research publications into more understandable desired daily language. This application bridges the use of scientific result studies to benefit the community from the higher education source. This platform also planned as a tool to disseminate knowledge from trusted sources for citizens which do not have opportunity getting higher degree of education. In the next level, the Artificial Intelligence (AI) will be used, so the extraction of research papers can be easily understood in the form of more comprehensive options that are easily understood by the non-scientist community. The Bridge very suitable to be developed for mobile application (Google play and IOS) and will give rapid push successful high quality knowledge dissemination for European citizens. By using The Bridge as tool, it will make smarter community with sustainable support from universities paper-based studies. Collaboration from several scientist, universities, stake holder and funding are needed to develop this idea.
